LOWER COSTS FOR MEDIA REPLACEMENT

Issue 3, 1998

When it comes to providing service and support to RBC owners and operators, RBC Services always tries to offer options regarding replacement RBC equipment and repairs.

In many cases when repairs were needed, we have provided options to keep those repair costs down. And in other cases when replacements were thought to be needed, we either provided methods for repair, or kept costs down on replacement parts, all in an effort to save you time and money.

In keeping with that tradition, you now have an option regarding replacement media for CLOW RBCs with a cage type media support structure which uses bars on top to keep the media in place. While there is still a cost involved, that cost is held to a minimum.

The media is configured to fit into the existing media support structure cage and comes in a variety of treatment surface areas to satisfy requirements. The media is shipped in pre-assembled bundles, easily handled by two people when being inserted in the structure. This method of assembly can *reduce downtime and installation costs by as much as 70%*.

The increased surface area per sheet also allows wider spacing which improves flow. The assembly method also prevents bulging of sheets which can cause a problem.

The first CLOW RBCs were shipped to installations in about 1973. The last CLOW RBCs manufactured with the cage type media support design were sold in 1984. That puts these units at a considerable age.

Over time, there may have been some concerns with this type media. If you are experiencing any media problems, give us a call. We can get you back on track and save you time and money as well.

Let me ask you. How many times have you had to schedule, prepare and purchase equipment for a repair project and managed to save costs? It *can* happen the next time.

Should you ever have questions regarding any type of RBC concern or about your RBC operations in general, please do not hesitate to give us a call. I'm sure we can help.
